

1 References in Action

Machine Learning is a branch of Artificial Intelligence that enables computers to learn patterns from data and make predictions without being explicitly programmed for every task [1]. It learns from examples and identifies relationships within the data to build useful models [2]. Machine Learning models are trained using data and can then be used to make predictions on new or unseen data [3]. It is widely used in healthcare, finance, education, agriculture, computer vision [4], and natural language processing [4]. The quality of data is very important because accurate, complete, relevant, and representative data helps Machine Learning models produce reliable results.
